DETAILED ACTION

Specification

1. Applicant is reminded of the proper content of an abstract of the disclosure.

A patent abstract is a concise statement of the technical disclosure of the patent and should include that which is new in the art to which the invention pertains. If the patent is of a basic nature, the entire technical disclosure may be new in the art, and the abstract should be directed to the entire disclosure. If the patent is in the nature of an improvement in an old apparatus, process, product, or composition, the abstract should include the technical disclosure of the improvement. In certain patents, particularly those for compounds and compositions, wherein the process for making and/or the use thereof are not obvious, the abstract should set forth a process for making and/or use thereof. If the new technical disclosure involves modifications or alternatives, the abstract should mention by way of example the preferred modification or alternative.

The abstract should not refer to purported merits or speculative applications of the invention and should not compare the invention with the prior art.

Where applicable, the abstract should include the following:

- (1) if a machine or apparatus, its organization and operation;
- (2) if an article, its method of making;
- (3) if a chemical compound, its identity and use;
- (4) if a mixture, its ingredients;
- (5) if a process, the steps.

Extensive mechanical and design details of apparatus should not be given.

2. The abstract of the disclosure is objected to because it does not have a concise statement of the technical disclosure. Correction is required. See MPEP § 608.01(b).

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Application/Control Number: 10/716,734

Art Unit: 2835

4. Claims 1-25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Eesley et al. Pat. ,529 in view of Huang.

Eesley discloses the heat sink having a heat transfer portion 20, parallel fins 22 extending from the heat transfer portion 20, a porous medium 24 such as metal foam inserted between the fins 24, thermally conductive adhesive is used to attach porous medium to the fins (col. 4, lines 59-61), the porosity of the metal foam is about ninety percent (col. 5, line 57). Eesley discloses the claimed invention except that the heat sink is remote from the heat source and does not show the fan and does not specify the pore density of five pores per inch. Huang discloses the cooling arrangement for a computer system of a microprocessor of having the heat sink 60 remote from the heat source and the fan 70 provides airflow toward the remote heat sink 60. It would have been obvious at the time the invention was made to a person having ordinary skill in the art to use the heat sink as disclosed by Eesley in the device disclosed by Huang since Eesley discloses the method of removing heat from the heat sink by using forced air for efficient cooling (col. 3, lines 22-30). The porous medium having 5 pores per inch density is commercially available and is disclosed in the prior art, which is not applied at this time. listed in the US PTO Form 892 attached. The method steps of claims 15-19 are necessitated by the device structure as disclosed by Eesley. The details drawn to a battery adapter providing power for a portable computer system are known and it appears to be not proven as critical for the invention.
